Calculation of the proton bremsstrahlung

https://github.com/gramolin/esepp/

The FeynCalc package:

```
|n[1]:= << HighEnergyPhysics`FeynCalc`</pre>
```

The squares of the four-momenta:

```
In[2]:= ScalarProduct[1, 1] = m<sup>2</sup>;
ScalarProduct[p, p] = M<sup>2</sup>;
ScalarProduct[1', 1'] = m<sup>2</sup>;
ScalarProduct[p', p'] = M<sup>2</sup>;
ScalarProduct[k, k] = 0;
```

The lepton tensor:

$$ln[7] = L = \frac{1}{2} Tr[(GS[1] + m).GA[v].(GS[1'] + m).GA[\mu]];$$

The proton tensor:

$$\begin{split} & \ln[8] = \ P_1 = \frac{1}{2} \ \text{Tr} \Big[\ (\text{GS}[p'] + M) \cdot \left((\text{F10} + \text{F20}) \ \text{GA}[\alpha] - \frac{\text{F20}}{2 \, \text{M}} \ (\text{FourVector}[2 \, p' + k, \, \alpha] - \text{GA}[\alpha] \cdot (\text{GS}[p' + k] - M)) \right) \cdot \\ & \frac{\text{GS}[p' + k] + M}{2 \, \text{ScalarProduct}[k, \, p']} \cdot \left((\text{F12} + \text{F22}) \ \text{GA}[\mu] - \frac{\text{F22}}{2 \, \text{M}} \ (\text{FourVector}[p + p' + k, \, \mu] - (\text{GS}[p' + k] - M) \cdot \text{GA}[\mu]) \right) \cdot \\ & (\text{GS}[p] + M) \cdot \left((\text{F10} + \text{F20}) \ \text{GA}[\alpha] - \frac{\text{F20}}{2 \, \text{M}} \ (\text{FourVector}[2 \, p - k, \, \alpha] - \text{GA}[\alpha] \cdot (\text{GS}[p - k] - M)) \right) \cdot \\ & \frac{\text{GS}[p - k] + M}{2 \, \text{ScalarProduct}[k, \, p]} \cdot \left((\text{F12} + \text{F22}) \ \text{GA}[\gamma] - \frac{\text{F22}}{2 \, \text{M}} \ (\text{FourVector}[p + p' - k, \, \gamma] - (\text{GS}[p - k] - M) \cdot \text{GA}[\gamma]) \right) \Big]; \end{split}$$

```
 \begin{split} & \ln[9] = \ P_2 = -\frac{1}{2} \ Tr \bigg[ \left( \text{GS} \left[ p^+ \right] + \text{M} \right) \cdot \bigg( \left( \text{F10} + \text{F20} \right) \ \text{GA} \left[ \alpha \right] - \frac{\text{F20}}{2 \ \text{M}} \ \left( \text{FourVector} \left[ 2 \ p^+ + k , \, \alpha \right] - \text{GA} \left[ \alpha \right] \cdot \left( \text{GS} \left[ p^+ + k \right] - \text{M} \right) \right) \bigg) \, . \\ & \frac{\text{GS} \left[ p^+ + k \right] + \text{M}}{2 \ \text{ScalarProduct} \left[ k , \, p^+ \right]} \cdot \bigg( \left( \text{F12} + \text{F22} \right) \cdot \text{GA} \left[ \mu \right] - \frac{\text{F22}}{2 \ \text{M}} \ \left( \text{FourVector} \left[ p + p^+ + k , \, \mu \right] - \left( \text{GS} \left[ p^+ + k \right] - \text{M} \right) \cdot \text{GA} \left[ \mu \right] \right) \bigg) \, . \\ & \left( \text{GS} \left[ p \right] + \text{M} \right) \cdot \bigg( \left( \text{F12} + \text{F22} \right) \cdot \text{GA} \left[ \nu \right] - \frac{\text{F22}}{2 \ \text{M}} \ \left( \text{FourVector} \left[ p + p^+ + k , \, \nu \right] - \text{GA} \left[ \nu \right] \cdot \left( \text{GS} \left[ p^+ + k \right] - \text{M} \right) \cdot \bigg) \bigg) \, . \\ & \frac{\text{GS} \left[ p^+ + k \right] + \text{M}}{2 \ \text{ScalarProduct} \left[ k , \, p^+ \right]} \cdot \bigg( \left( \text{F10} + \text{F20} \right) \ \text{GA} \left[ \alpha \right] - \frac{\text{F20}}{2 \ \text{M}} \ \left( \text{FourVector} \left[ 2 \ p^+ + k , \, \alpha \right] - \left( \text{GS} \left[ p^+ + k \right] - \text{M} \right) \cdot \text{GA} \left[ \alpha \right] \right) \bigg) \bigg]; \\ & \ln[10] = \ P_3 = P_1 \ / \cdot \left\{ p \rightarrow -p^+, \, p^+ \rightarrow -p \right\}; \\ & \ln[11] = \ P_4 = P_2 \ / \cdot \left\{ p \rightarrow -p^+, \, p^+ \rightarrow -p \right\}; \end{aligned}
```

Contraction of the lepton and proton tensors:

```
|n|_{12}:= Output = Simplify[Contract[L P<sub>1</sub>] + Contract[L P<sub>2</sub>] + Contract[L P<sub>3</sub>] + Contract[L P<sub>4</sub>]];
```

Convenient notations for the products of the four-momenta:

```
In[13]:= ScalarProduct[k, 1] = kfli;
ScalarProduct[k, l'] = kflf;
ScalarProduct[k, p] = kfpi;
ScalarProduct[k, p'] = kfpf;
ScalarProduct[l, l'] = lilf;
ScalarProduct[l, p] = lipi;
ScalarProduct[l, p'] = lipf;
ScalarProduct[p, p'] = pipf;
ScalarProduct[l', p] = lfpi;
ScalarProduct[l', p] = lfpi;
ScalarProduct[l', p'] = lfpi;
```

Output to the text file:

```
In[23]:= CForm[Output] >> "cform proton.txt";
```
